Course description

Health systems face significant challenges in moving towards integrated care. Despite long time policy pressures and the existence of best practice models at international level, integrated care frequently remains limited to pilot projects.

This course is designed to help participants build and extend their understanding of evaluating integrated care programs. Through discussions and analyses of current conceptual and methodological developments in the care evaluation discipline and some of its main reference disciplines, participants will advance their skills of reflecting different approaches in evaluating care programs. In terms of teaching formats, the course will be using a mixture of formats and approaches – from traditional lectures to interactive seminar sessions.

Course Content:

This course starts by reviewing and discussing reasons why pilot projects are not scaled up. The focus will be on methodological challenges in evaluating integrated care
programs. Challenges will be illustrated with a case study of a comprehensive evaluation of an integrated care pilot project.

The second part of this course focuses on new methodological and conceptual directions in evaluating integrated care programs.

Notice: The program is subject to change.
